

Creating a high quality business impression is what most companies wish to accomplish. Whether you are a large company or a retail store, your customers will form an impression through the atmosphere you have created on your premises. Exactly the same applies on your telephone, when callers are put "on-hold". Professionals know how important it is to keep things simple, to make a professional business impression.

By loading production software like our **PineWoodStudio** and the **gear2voice** onto one PC at your main address, a number of flash memory cards can be produced carrying the latest audio updates and sent to all your other sites. The previously used flash memory cards can then be returned to your main address and updated again when needed.

But the VGP-70 can also simultaneously run a photo slide show. By activating the "music slide show" key on the IR Remote control pad, your music files will be played onto your PBX and the slides will be shown on a TV/Video screen in your company's reception area or displayed in your shop windows. Video files can also be played in a similar way providing that the audio channels in the video recording have been recorded with your music on-hold audio files.

Depending upon your needs, the **VGP-70** is available in 3 versions : The "**Satelite**" version, ready to play all your files. The "**Standard**" version comes with the **PineWoodStudio** software to mix music and messages into MOH files and the "**PRO**" version also including the **gear2voice** software to create your personal messages mixable through the **PineWoodStudio**. Considering maybe that no slides or video would be needed today, the **VGP-70** only costs as little as a conventional MOH system but with a leading edge over all of its competitors.
